

CHALLENGES FROM COASTAL SHORELINE RETREAT—PLANNING FOR NOW AND THE FUTURE

2020
WEBINAR
SERIES

This webinar hosted by **NEWEA's Watershed Management Committee**, will consist of two presentations that will focus on resiliency planning for coastal shorelines.

THE FIRST PRESENTATION will focus on shoreline erosion, loss of wetlands, rising sea levels, and dimensioning fishery resources along the Dauphin Island

Causeway, the sole roadway to the “sunset Capital of Alabama,” as it threatens the way of life of multiple people groups. Learn how diverse groups are coming together to

restore the shoreline and improve resilience through the restoration of three miles of living shoreline and nearly 100 acres of marsh habitat.

THE SECOND PRESENTATION will take a look at how building resilience in a changing world, requires an understanding of future risks rather than what has been experienced in the past. Acknowledging this, the Technical Mapping Advisory Council (TMAC) recommended that FEMA reevaluate its approach to mapping erosion hazards and provide future conditions products and information to coastal communities. For these communities, sea level rise (SLR) has the potential to significantly accelerate future shoreline retreat. Shoreline retreat is related to but distinct from the frequently studied hazards related to coastal inundation, and it is important to consider it in coastal planning contexts to adequately assess future risk. To meet this need and apply the TMAC recommendations, FEMA Region I funded a pilot study to estimate long term coastal erosion hazards which incorporate future SLR into the results. This non-regulatory mapping product provides coastal communities with a tool to understand their potential erosion risk in the coming century. Upon successful completion of the pilot study, FEMA has continued the development of these coastal erosion hazard products across over 1500 miles of coastline throughout the Northeast. It is hoped that this study could be further expanded to other areas.

SPEAKERS

Wade Burcham is a PE that serves as Principal Water Resources Engineer with Geosyntec. His 23 years of experience focused on natural stream stabilization, water resources engineering, stormwater management, municipal engineering, and contract administration has facilitated a balanced viewpoint from multiple perspectives. Wade enjoys learning Sustainable and Innovative Design Practices and applying those techniques in developing countries through his volunteer work with Engineering Ministries International and other Faith-Based Mission efforts.

Brian Caufield, P.E., CFM, PMP, D.CE is CDM Smith's Coastal Systems Resilience Discipline Lead. He has been identifying and mapping coastal flood hazards throughout the United States for over 15 years. He is helping communities recover after coastal storms and work towards identifying and building resilient infrastructure.

Wednesday, August 5
Noon – 1:00 PM
