WORKING FOR WATER OUALITY

## NEWEA Formula/Conversion Table for Lab Analyst Exam

```
Average = (Sum of Measurements)/(Number of Measurements)
Geometric Mean = [(X1)(X2)(X3)(Xn)}\mp@subsup{]}{}{1/n
Dilutions: (N1)}(\mp@subsup{\textrm{V}}{1}{})=(\mp@subsup{N}{2}{})(\mp@subsup{\textrm{V}}{2}{}
% Removal = (In - Out)(100%)/ln
Lbs of solids = (8.34)(Q, MG)(mg/L)
TSS, mg/L = {(mass of filter and solids after drying - mass of filter) }\times1000\textrm{mL}/\textrm{L
    x1000 mg/g} / (mL of sample)
\(\mathbf{V S S}, \mathbf{m g} / \mathbf{L}=\{(\) mass of filter and solids after drying - mass of filter and solids after ignition) \(\times 1000 \mathrm{mg} / \mathrm{g}\} /\) (mL of sample)
\% TS = (mass of dry solids) \(\times\) (100) / (mass of wet solids)
\(\%\) VS = (mass of volatile solids) \(\times\) (100) / (mass of dry solids)
\(B^{3 O D}, \mathbf{m g} / \mathbf{L}=\left(\left(D_{1}-D_{2}\right)-(S) V_{s}\right) / P\)
\(\mathrm{D}_{1}=\) Initial DO
\(D_{2}=D O\) after 5 days
\(\mathrm{S}=\) Oxygen uptake of seed ( \(\Delta \mathrm{DO} / \mathrm{mL}\) seed suspension added per bottle). If sample is unseeded, then \(\mathrm{S}=0\).
\(\mathrm{V}_{\mathrm{s}}=\) Volume of seed in respective BOD bottle
\(\mathrm{P}=\) decimal volumetric fraction of sample used.
```

## Conversions:

To convert F to $\mathrm{C}: \quad \mathrm{F}=((9)(\mathrm{C}) / 5)+32$
To convert C to F: $\quad C=(F-32)(5) / 9$
1 cubic foot $=7.48$ gallons
1 gallon of water $=8.34 \mathrm{lbs}$
1 gallon = 3.785 liters
$2.2 \mathrm{~kg}=1 \mathrm{lbs}$
