

Data analytics for wet weather solutions: *sharing our experience in getting the most out of your data to achieve the best possible outcomes.*

Nicholas Anderson, Stantec

NEWEA CSO Wet Weather Issues Conference, September 29-30, 2021

Agenda

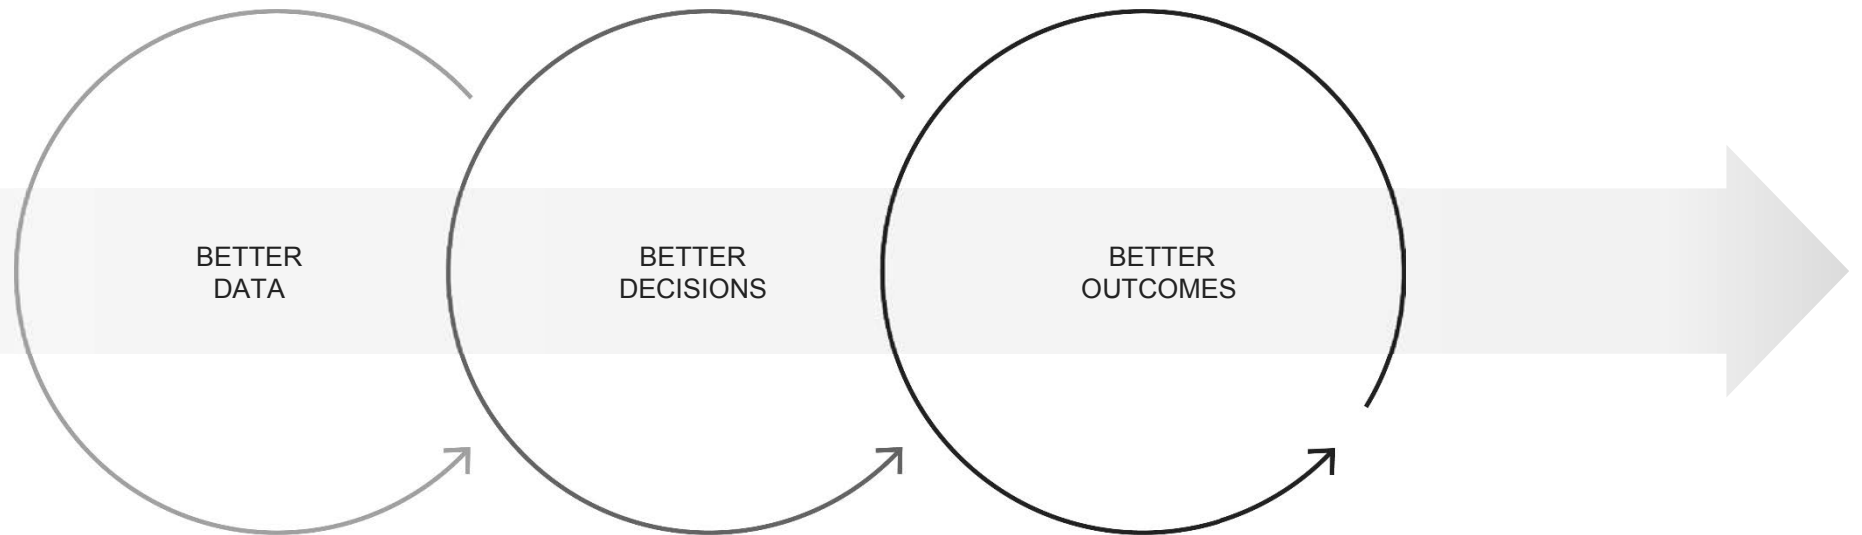

1. Making the move towards data analytics
2. What is data analytics achieving in Wet Weather?
3. Case studies
4. Key takeaways
5. Questions

MAKING THE MOVE TOWARDS DATA ANALYTICS

Making the move towards data analytics

Digital utilities use data and data analytics to help their organizations and people be more informed and achieve better outcomes

What's driving
the need for
data analytics?

Gartner Hype Cycle Model

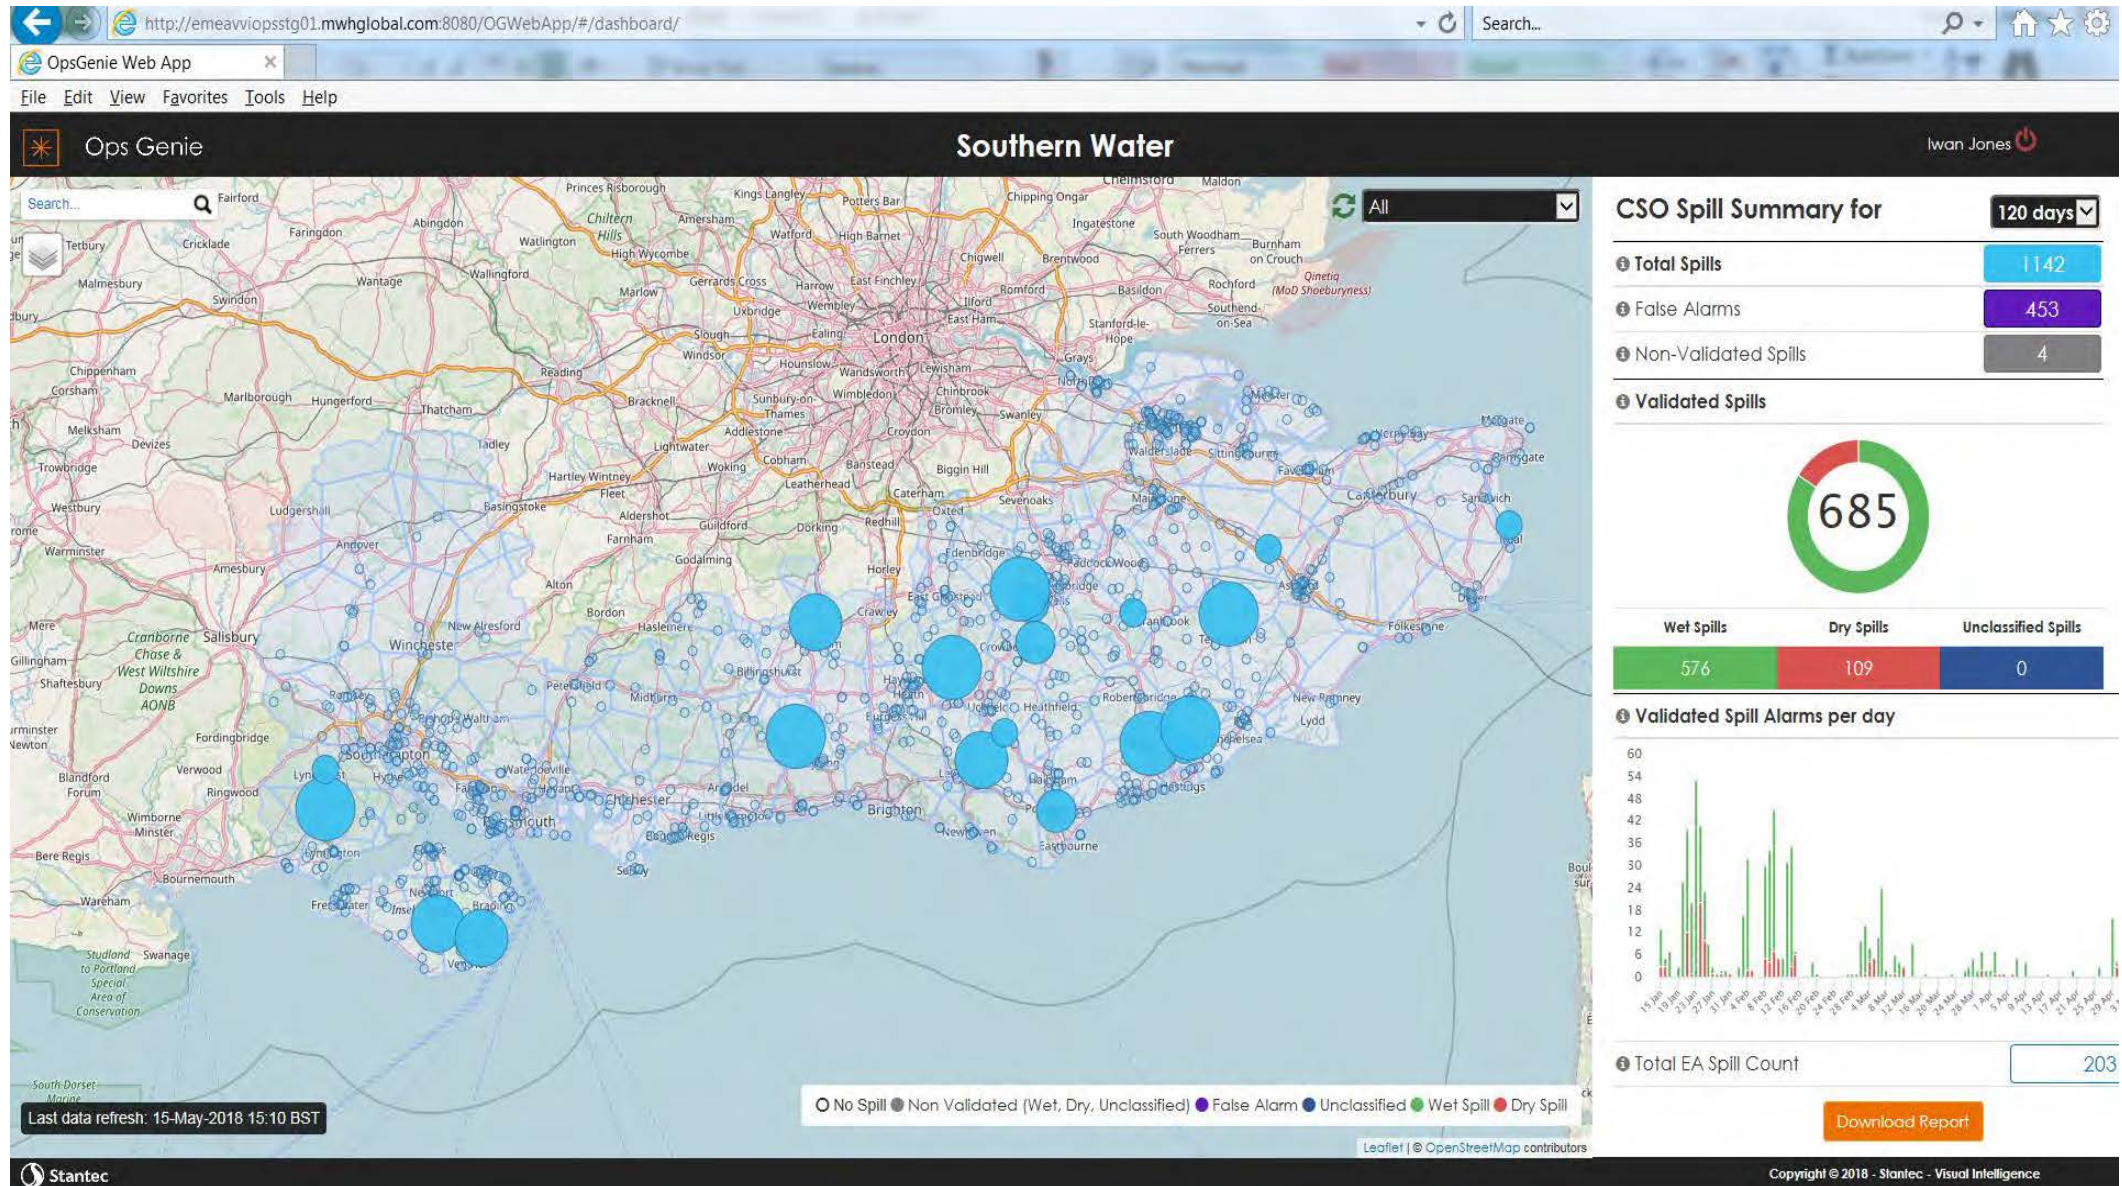

WHAT IS DATA ANALYTICS ACHIEVING IN WET WEATHER?

A night photograph of the San Francisco Bay Bridge, illuminated with warm lights. The bridge's suspension towers and cables are prominent against a dark sky. In the background, the San Francisco city skyline is visible, with numerous buildings lit up. The water of the bay is dark and reflects some of the lights.

What is data analytics achieving in Wet Weather?

WHAT IS DATA ANALYTICS ACHIEVING IN WET WEATHER?

WHAT IS DATA ANALYTICS ACHIEVING IN WET WEATHER?

Case Studies

Springfield Water & Sewer Commission: Regulatory reporting

Population Served:

105,000

Problem:

Increase system
understanding

Regulatory reporting

Solution:

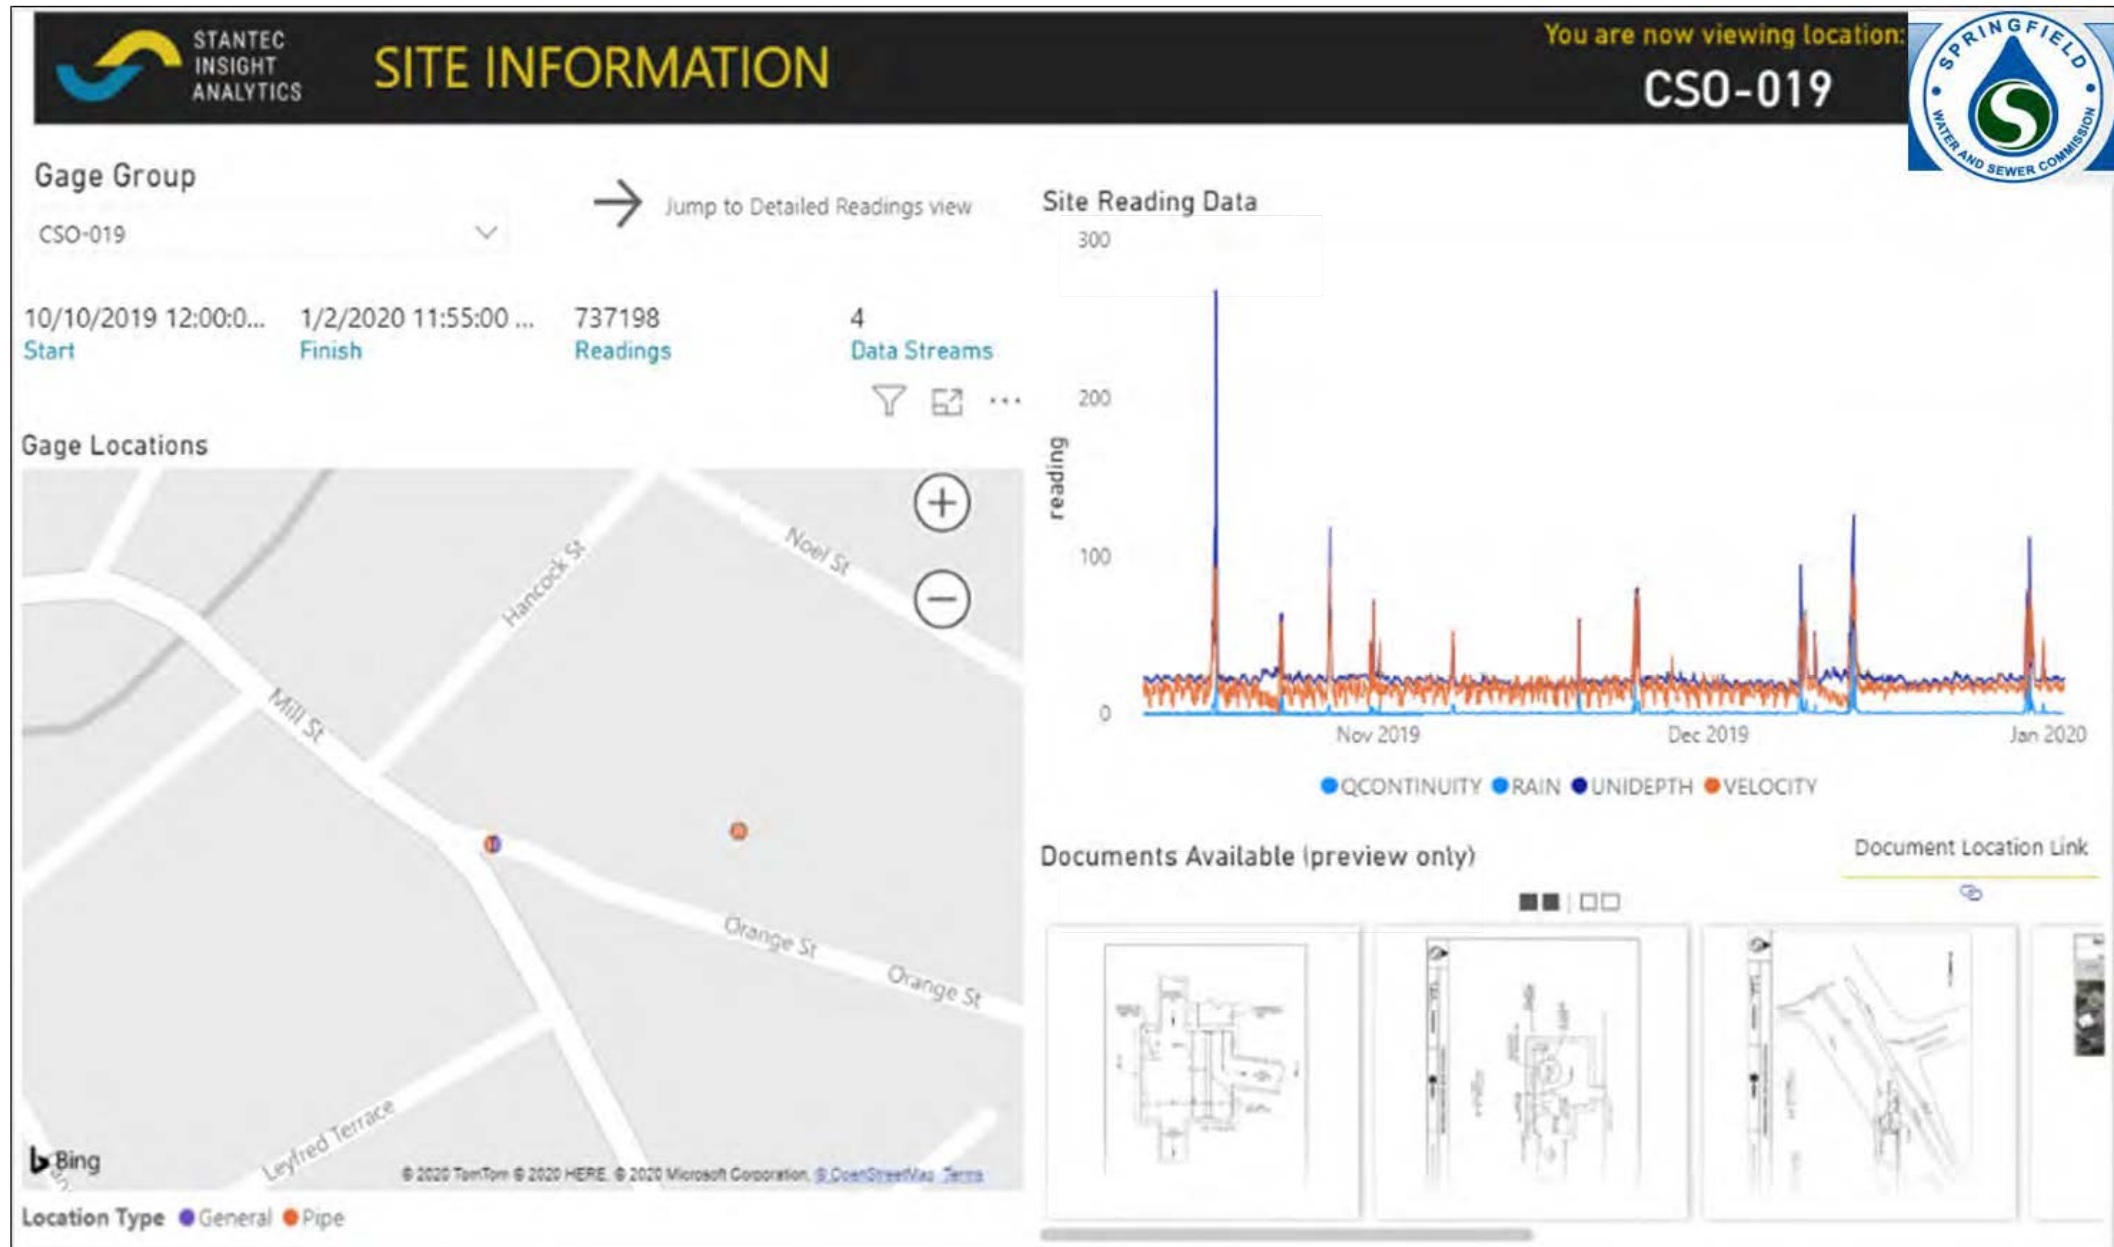

Data available for platform:

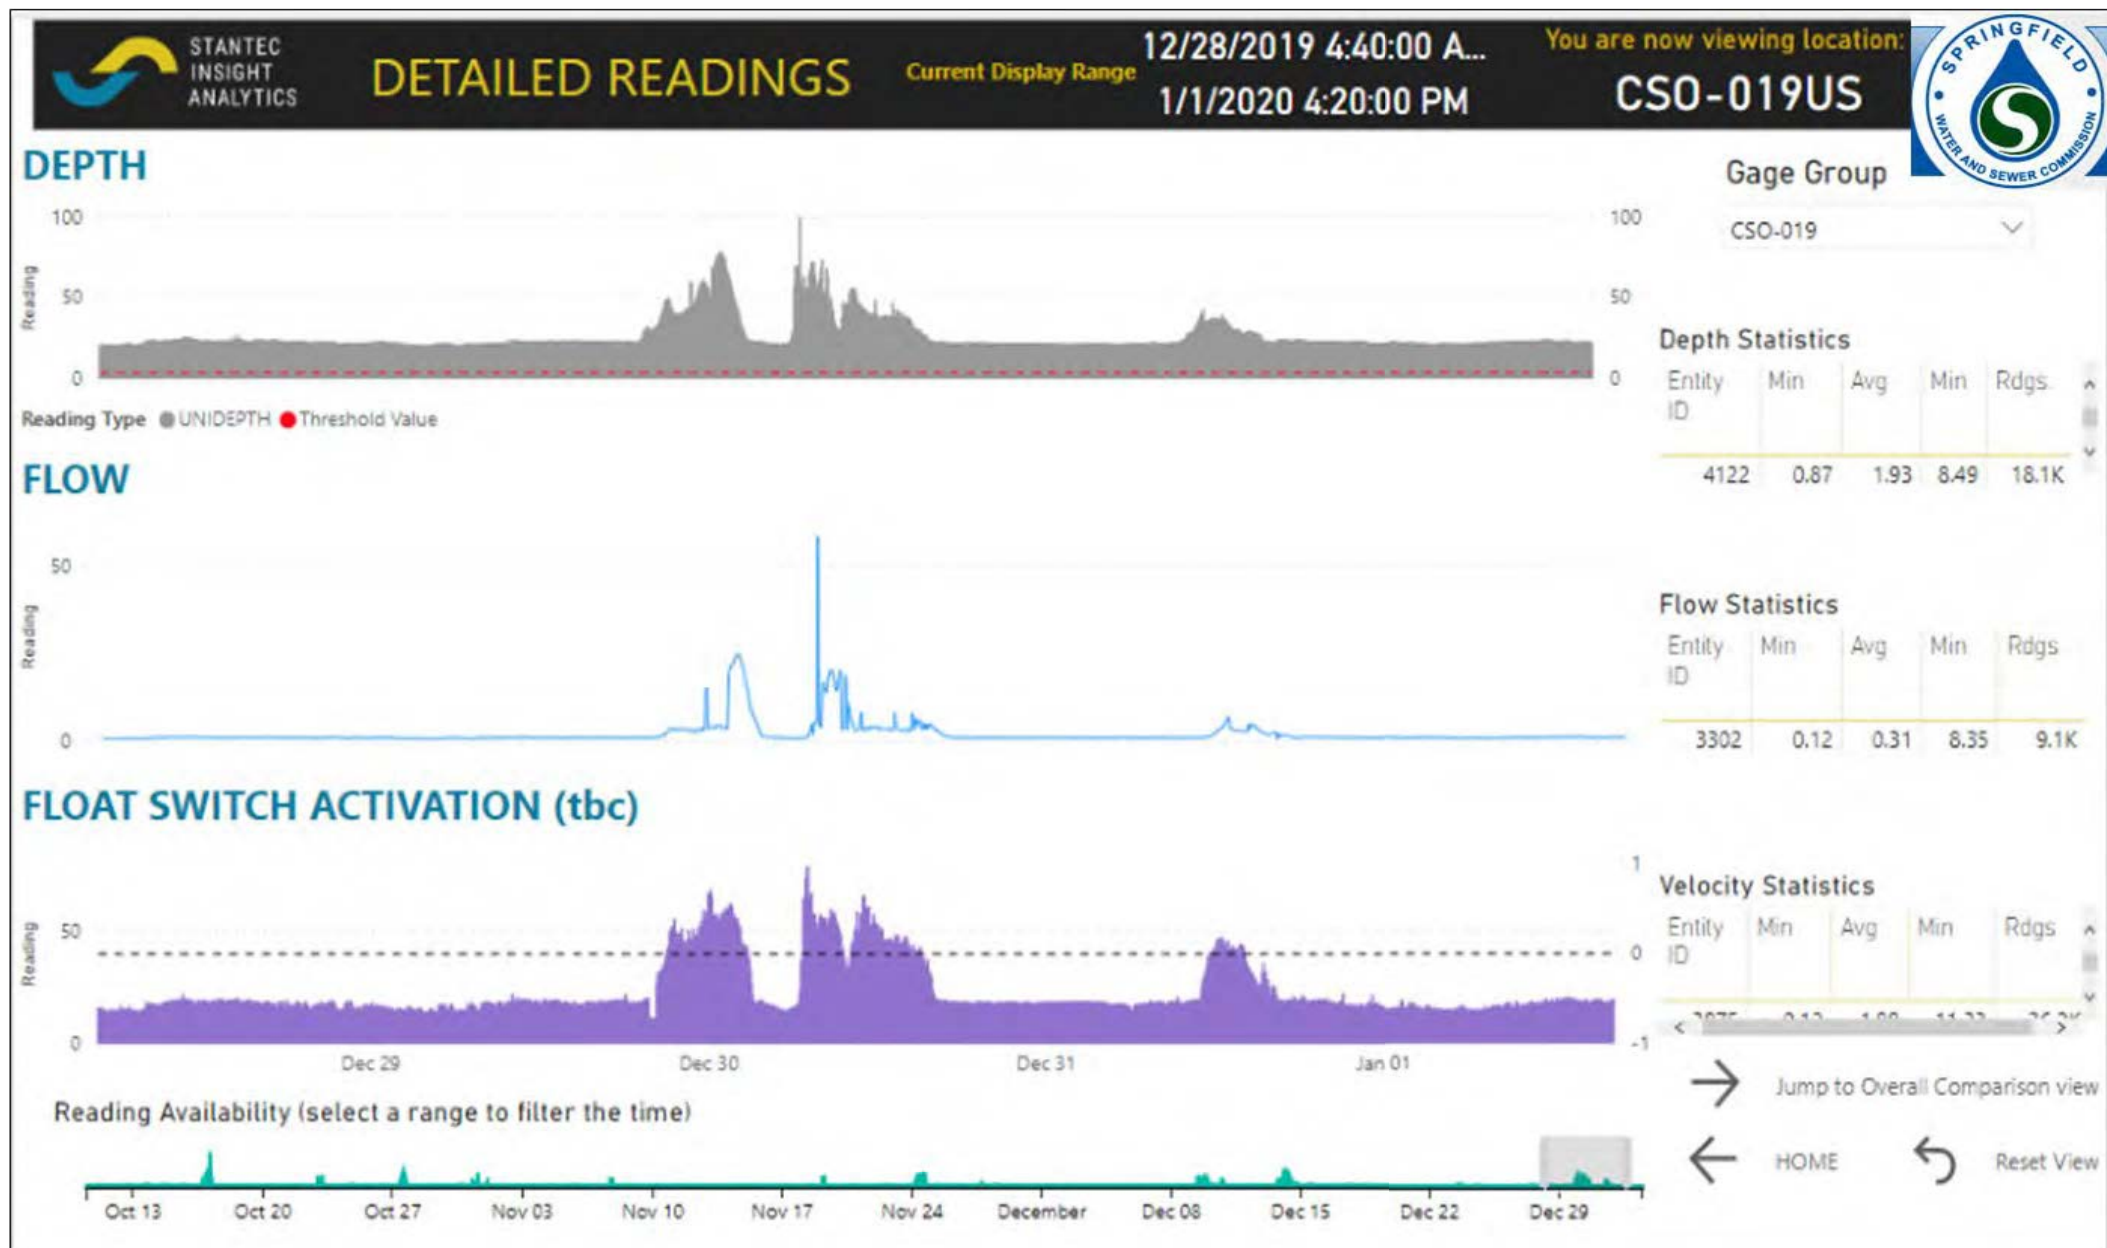

- Flow Metering

Result:

Pilot has proved the concept
and met all success criteria:

- Multiple data sources can be linked
- A simple dashboard will provide increased understanding
- Regulatory reporting within 4 hours is feasible

Wessex Water: Reducing sewer flooding by proactive blockage detection

Situation:

>50% reduction in the number of sewer flooding incidents

Significant fines for under-performance

Problem:

Many utilities need better visibility into how their assets are performing at a residential level to reduce costly flooding incidents

Solution:

Create a risk-based sensor network for better data on residential assets.

Use analytics to identify which alarms indicate higher risk of overflow.

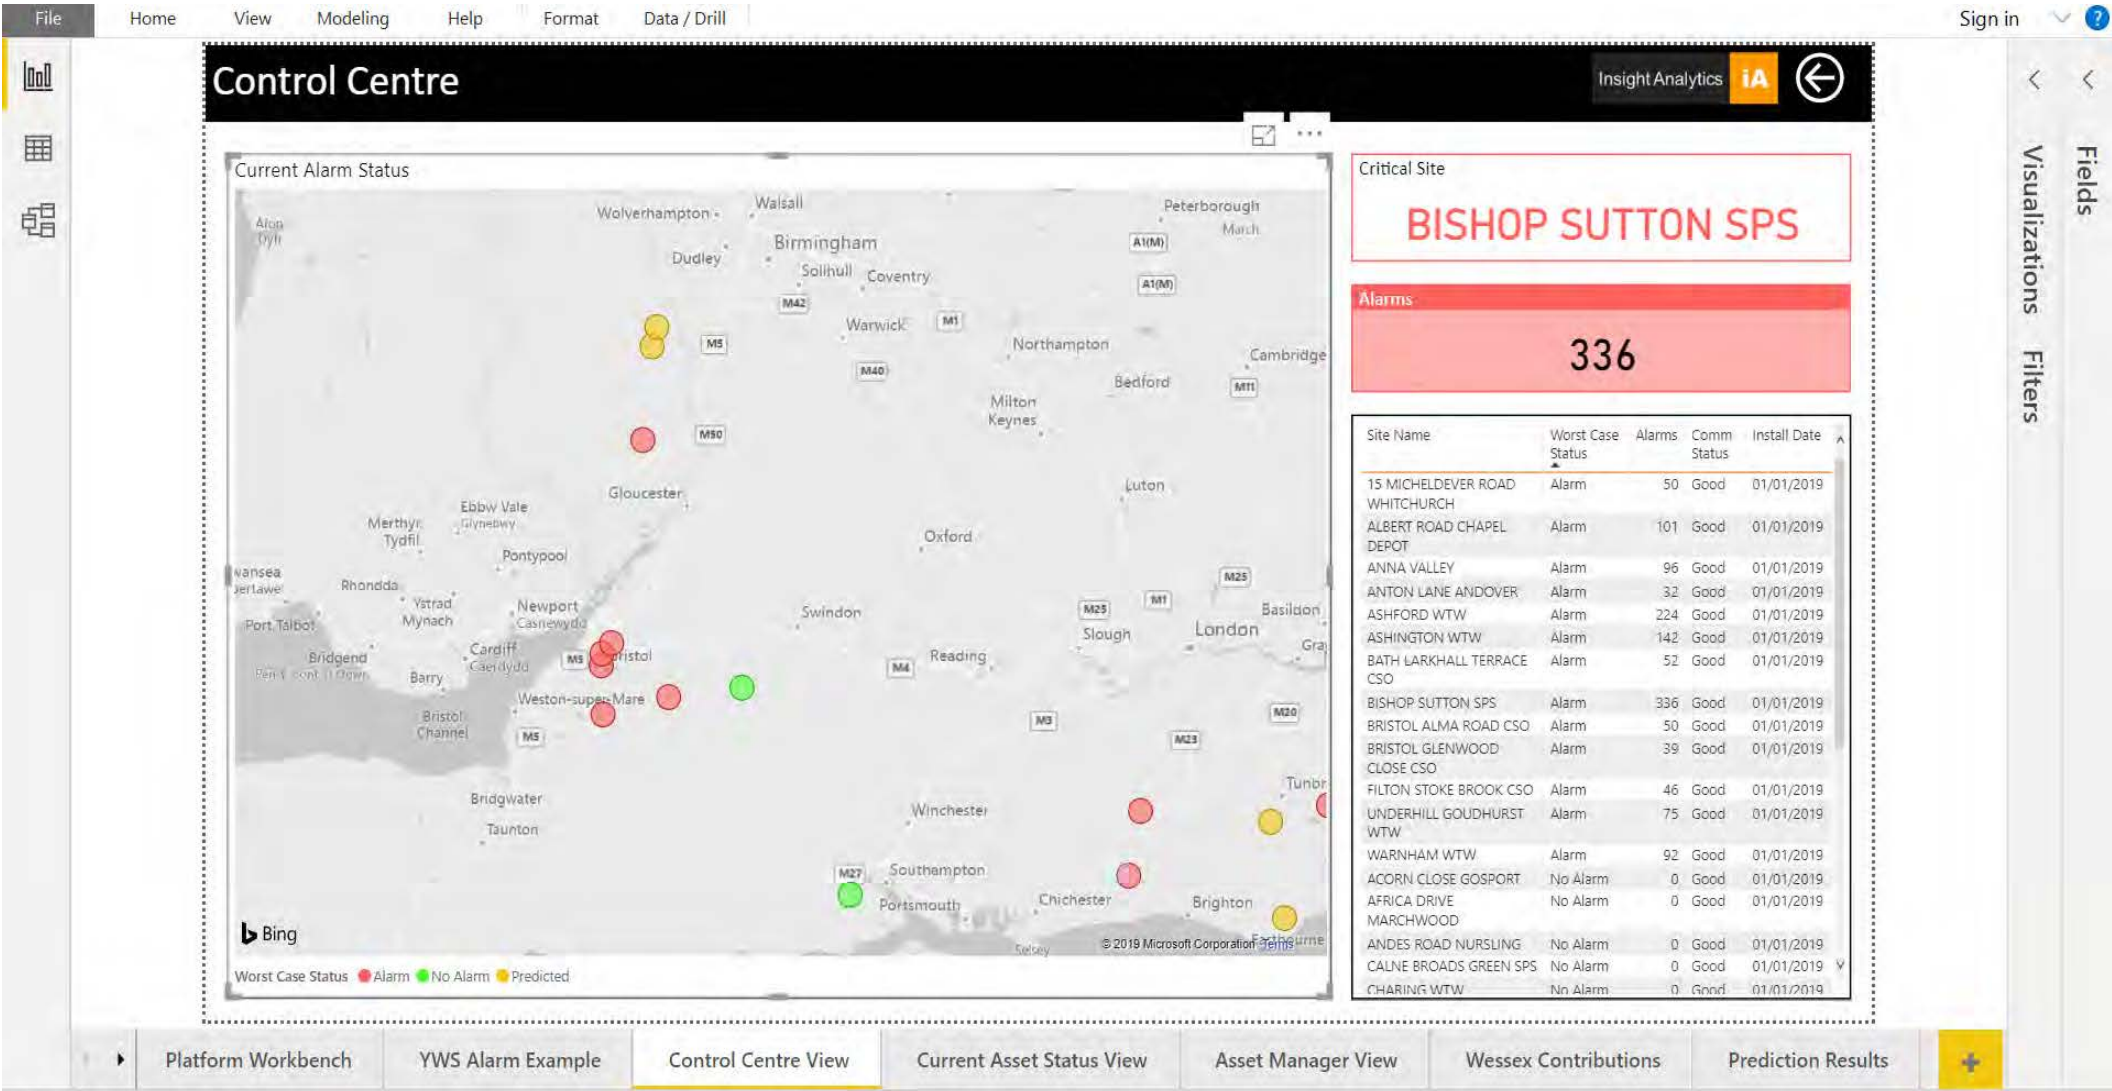

Improve business processes to realize desired outcome—fewer overflows.

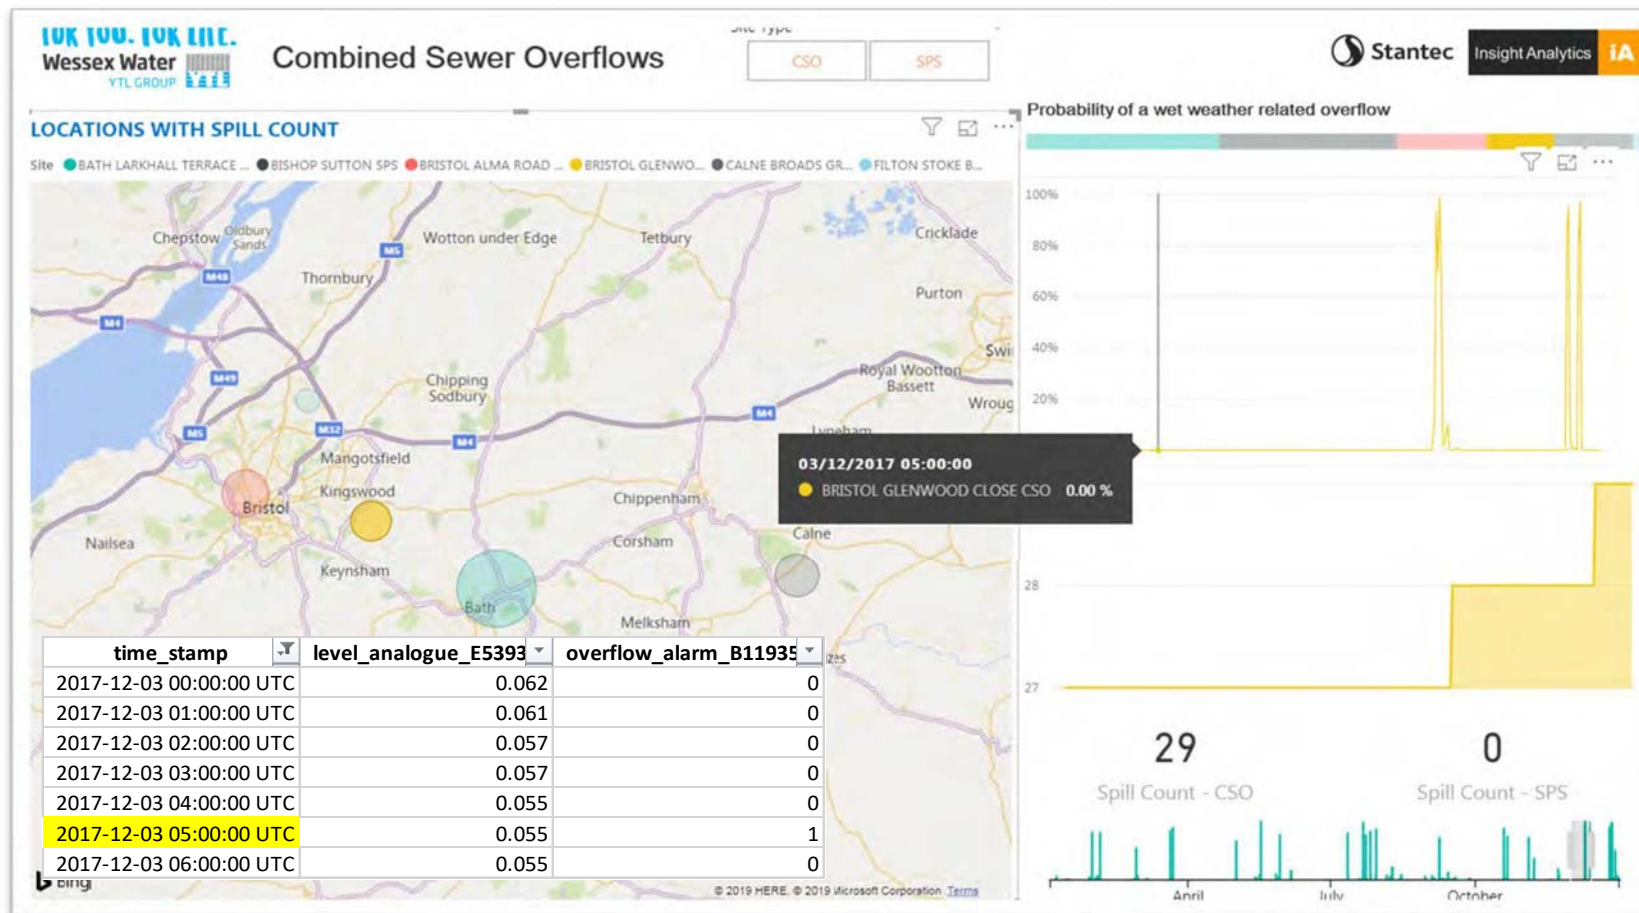

Result:

Incident reduction and improved customer engagement

Better understanding of assets at the residential level

Demonstrated value of using analytics to help reduce sewer flooding

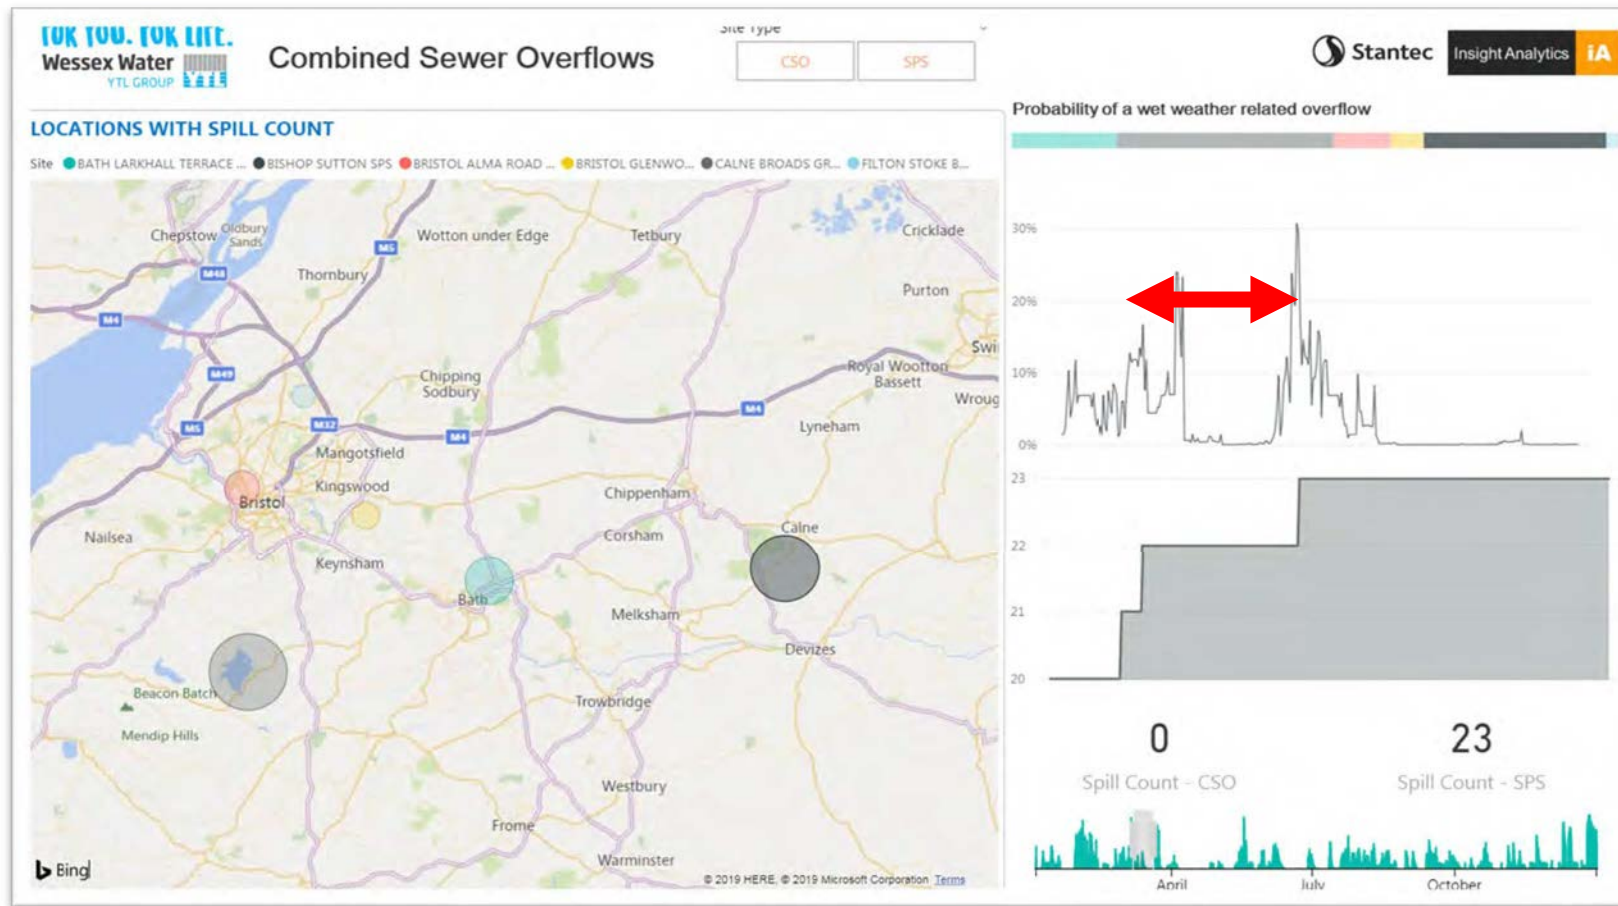

False overflow alarm at 05:00 identified and filtered out

Notify

Operational response:
Confidently do nothing

False alarm

High Confidence

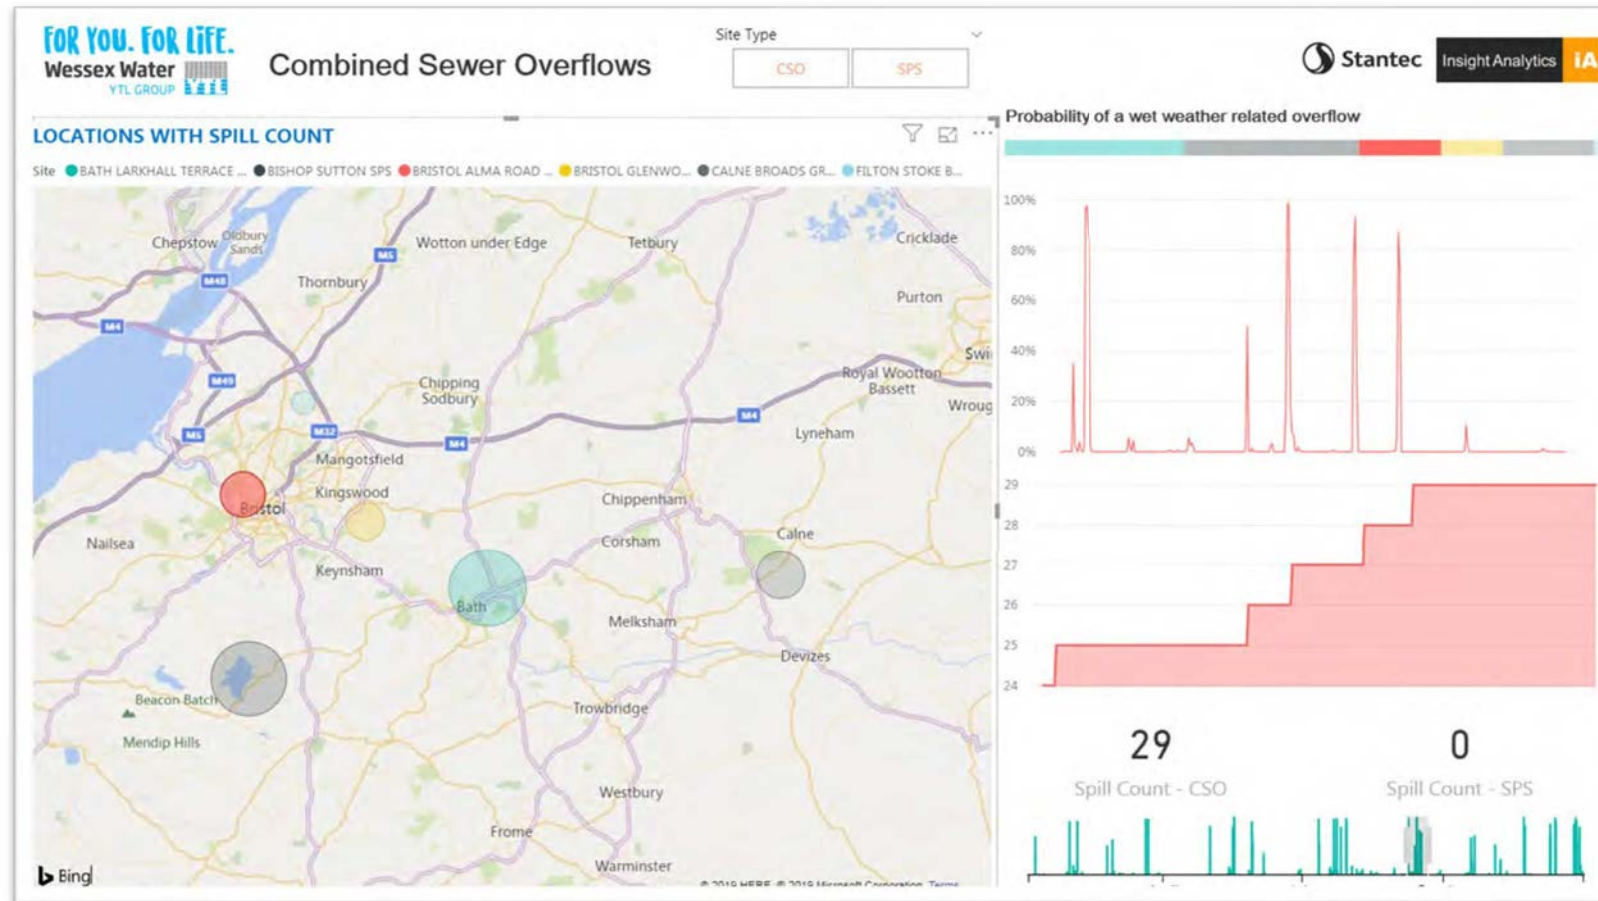

Three overflows occur when the probability of rainfall related overflow is less than 30%

Detect / Diagnose

Operational response:
Confidently action

Potential pollution

High Confidence

Each overflow consistently coincides with a high probability of a wet weather related overflow

Confirm

Operational response:
Confidently report and monitor

Wet weather overflow

High Confidence

Key Takeaways

Lessons Learned

- Create a **vision** with **outcomes** in and adopt a **phased approach** to build momentum
- **Prioritize** what you **need** to know and by what date
- **Data analytics** is **not** just adding **telemetry** and collecting data
- Choose the **right technology** for your vision, but be pragmatic
- **People** need to be at the **heart** of the process
- Review **performance** and if necessary, apply **corrective actions**
- Realizing the **value** of data analytics is a **journey** – don't expect the first generation to be the last

Data analytics for wet weather solutions: *sharing our experience in getting the most out of your data to achieve the best possible outcomes.*
