

# Correlating Operational Conditions to Activated Sludge Microbial Community in One Year of An A2O Process

Edris Taher<sup>1</sup>, Ph.D.

Mahsa Mehrdad<sup>2</sup>, Ph.D., P.E.

Karla Sangrey<sup>1</sup>, P.E.

Timothy Loftus<sup>1</sup>

1- Upper Blackstone Clean Water

2- Environmental Operating Solutions (EOS)

## Outline

- Upper Blackstone in a glance
- Molecular analysis Study
- Historical Challenges & Case Studies
- Correlating operational conditions to microbial community

# Upper Blackstone at a Glance

- Plant Information:

- Influent characterization:

- Avg Flow: 30 MGD
- Avg CBOD: 154 mg/L
- Avg TN: 28 mg-N/L

- Process configuration

- A2O
- 4 trains

- Regulation/Permit

- Seasonal permit
- TN: 5 mg-N/L  
Interim permit 6 mg-N/L
- TP: 0.1 mg-P/L  
Interim permit 0.45 mg-P/L 60 days rolling average

# Molecular Analysis Study- 16S RNA Amplicon Sequencing

- Molecular analysis Study, is the measurement of bacteria type and levels in wastewater through the real-time polymerase chain reaction, qPCR, technique.
- This is a well-known method that recently has been applied in the wastewater field to evaluate community-level infection trends like Covid-19.
- Correlating operational conditions to activated sludge microbial community will help us to predict and troubleshoot the process in advance.

## Normalized virus concentration over time

Normalized SARS-CoV-2 virus concentration (copies / L of sewage)

New cases in county on sampling date

# Historical Challenges

- High Blanket in Winter
- Occasional High Effluent Phosphorus in Summer
- Foaming in Spring

# I. High Blanket in Winter

- Due to:
  - Higher SVI, Higher influent flow, Conservative SRT to maintain nitrification
- Solution:
  - Developed a 5-step adjustment strategy to control the solids inventory (presented in NEWEA 2020)
  - Reduced Aerobic SRT from 13 to 8.7d

# The Most Abundant Nitrifiers

- The population of Nitrosomonas-AOB did not change in winter 2021 compared to September 2020.
- AOB and NOB populations remained in the typical range reported by MiDAS database.

*Dashed Lines: Median MiDAS :The median value based on long-term 16S rRNA amplicon sequencing surveys of >20 Danish full-scale BNR plants for activated sludge*

# II. Occasional High Effluent Phosphorus in Summer

- On Monday September 6<sup>th</sup>, Effluent Ortho-P increased significantly.
- TP Seasonal Permit: 0.45 mg-P/L (60-d rolling average)

Average FST Ortho-P (Probes data, SCADA)

Total P Final Effluent (Lab Data)

# II. Troubleshooting Example: High Effluent Ortho P

- Approach:
  - Analyzing Historical data & identifying the cause
  - Dosing MicroC<sup>®</sup> 2000 as Supplemental Carbon to Anaerobic Zone
- Result:
  - Reduced the ortho-P
  - Maintain our permit – No Violation
  - Long term approach: Dosing MicroC<sup>®</sup> to anaerobic zone on holidays and long weekends

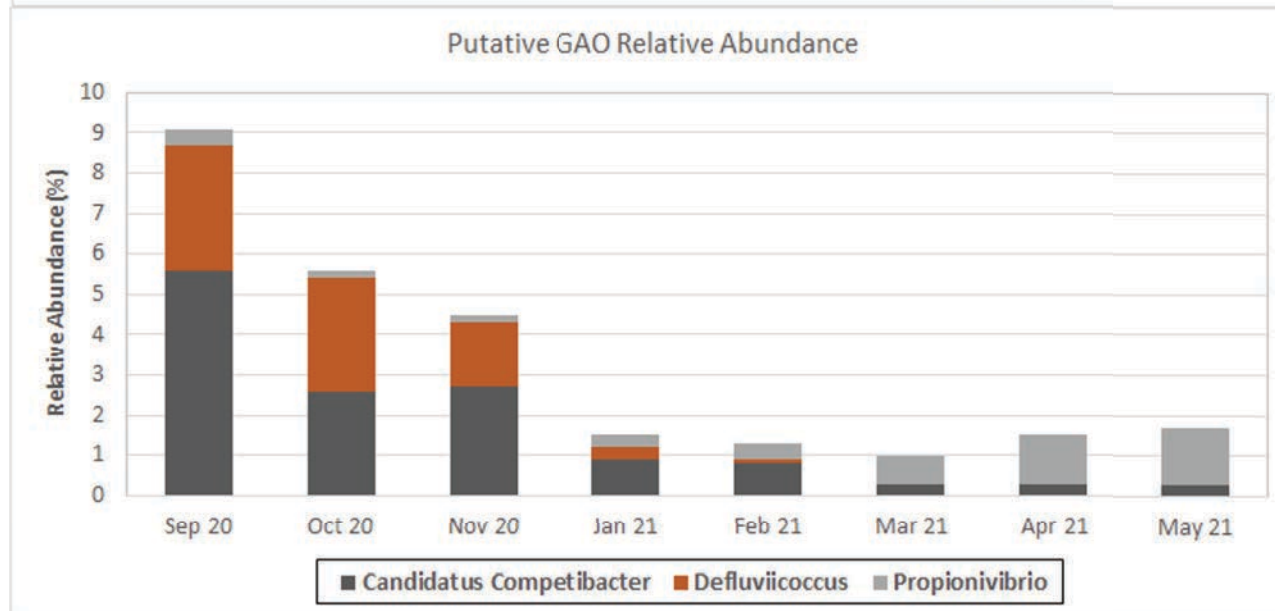

# The Effect of MicroC<sup>®</sup> 2000 on EBPR Process

# Putative PAOs and GAOs Population

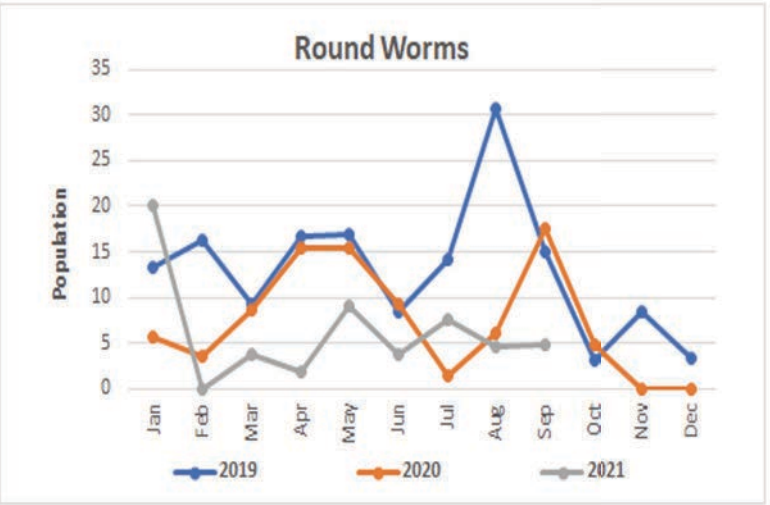

- Increase in overall putative PAOs (presumed PAOs) population after MicroC 2000 glycerol addition.

- Decreasing GAOs which could result in further increase in PAO population.

# Higher Life Form Identification

# Morphology Analysis

September 2020

# Zoogloea- Morphology Analysis vs 16S RNA Amplicon Sequencing

RANK	Abundance
4	Abundant
3	Common
2	Some
1	Few

# Microthrix- Morphology Analysis vs 16S RNA Amplicon Sequencing

Microthrix

RANK	Abundance
4	Abundant
3	Common
2	Some
1	Few

# Conclusions

- Controlling SRT in the range of 8-9 days in winter resulted in a significant reduction in secondary clarifiers blanket while did not adversely affect the nitrification.
- MicroC<sup>®</sup> 2000 addition in anaerobic zone proved to be beneficial on long weekends and holidays when the influent BOD/TP ratio is low. As a result, an increase in PAO population was observed.
- Microscopic and molecular analysis of the sludge are powerful tools to predict possible process upsets which can be used to troubleshoot the process in advance.
