Agenda

Project Background

Existing Inspection Strategy

Inspection Optimization Goals

Existing GIS Setup

Inspection Optimization Solutions

Project Overview

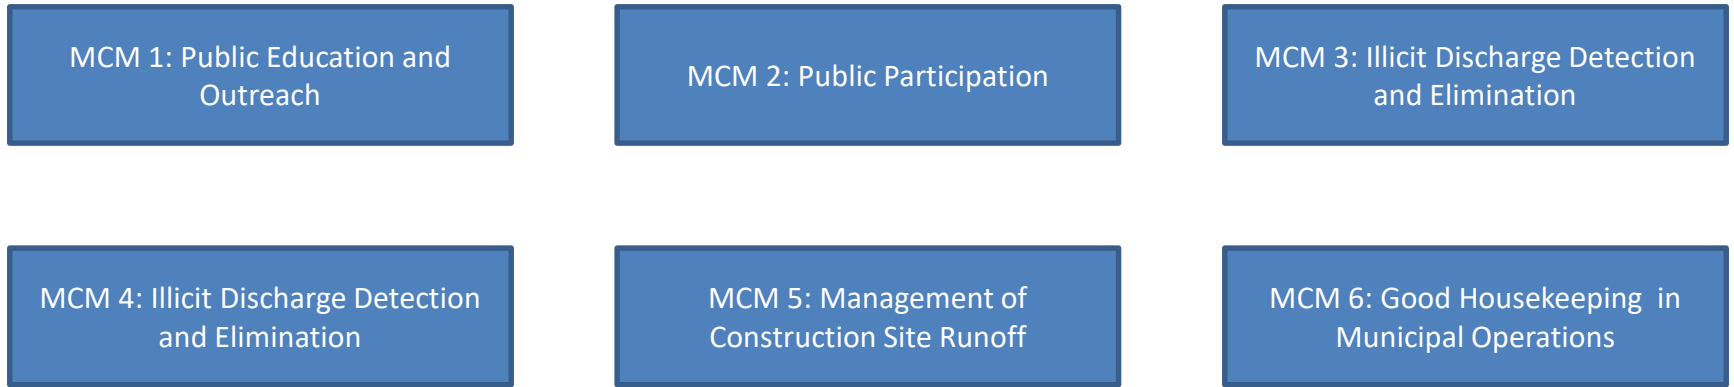

- **Massachusetts Department of Conservation and Recreation (DCR) Stormwater Program**
 - Municipal Separate Storm Sewer System (MS4) Permit Compliance

dcr
Massachusetts

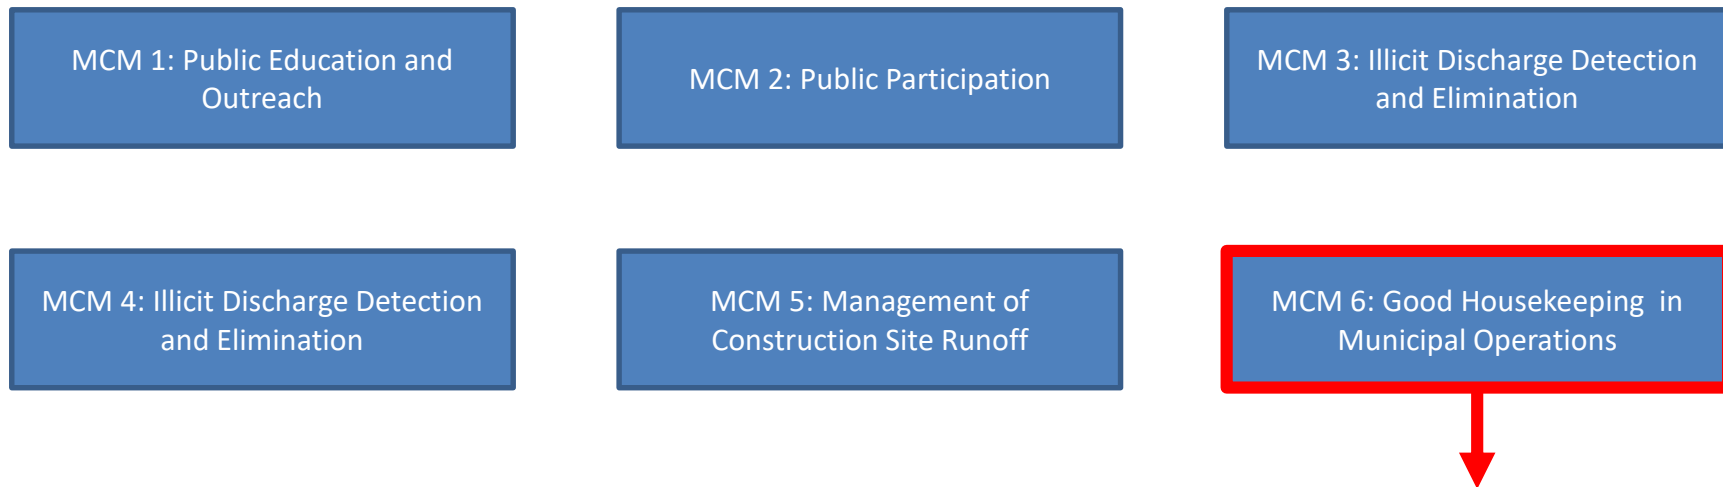

MS4 Permit Overview

- Requires permittees develop a stormwater management program that controls the quality of storm water discharged to the storm drains and thence waters of the United States
 - Specific requirements outlined in 6 minimum control measures

MS4 Permit Overview

- Requires permittees develop a stormwater management program that controls the quality of storm water discharged to the storm drains and thence waters of the United States
 - Specific requirements outlined in 6 minimum control measures

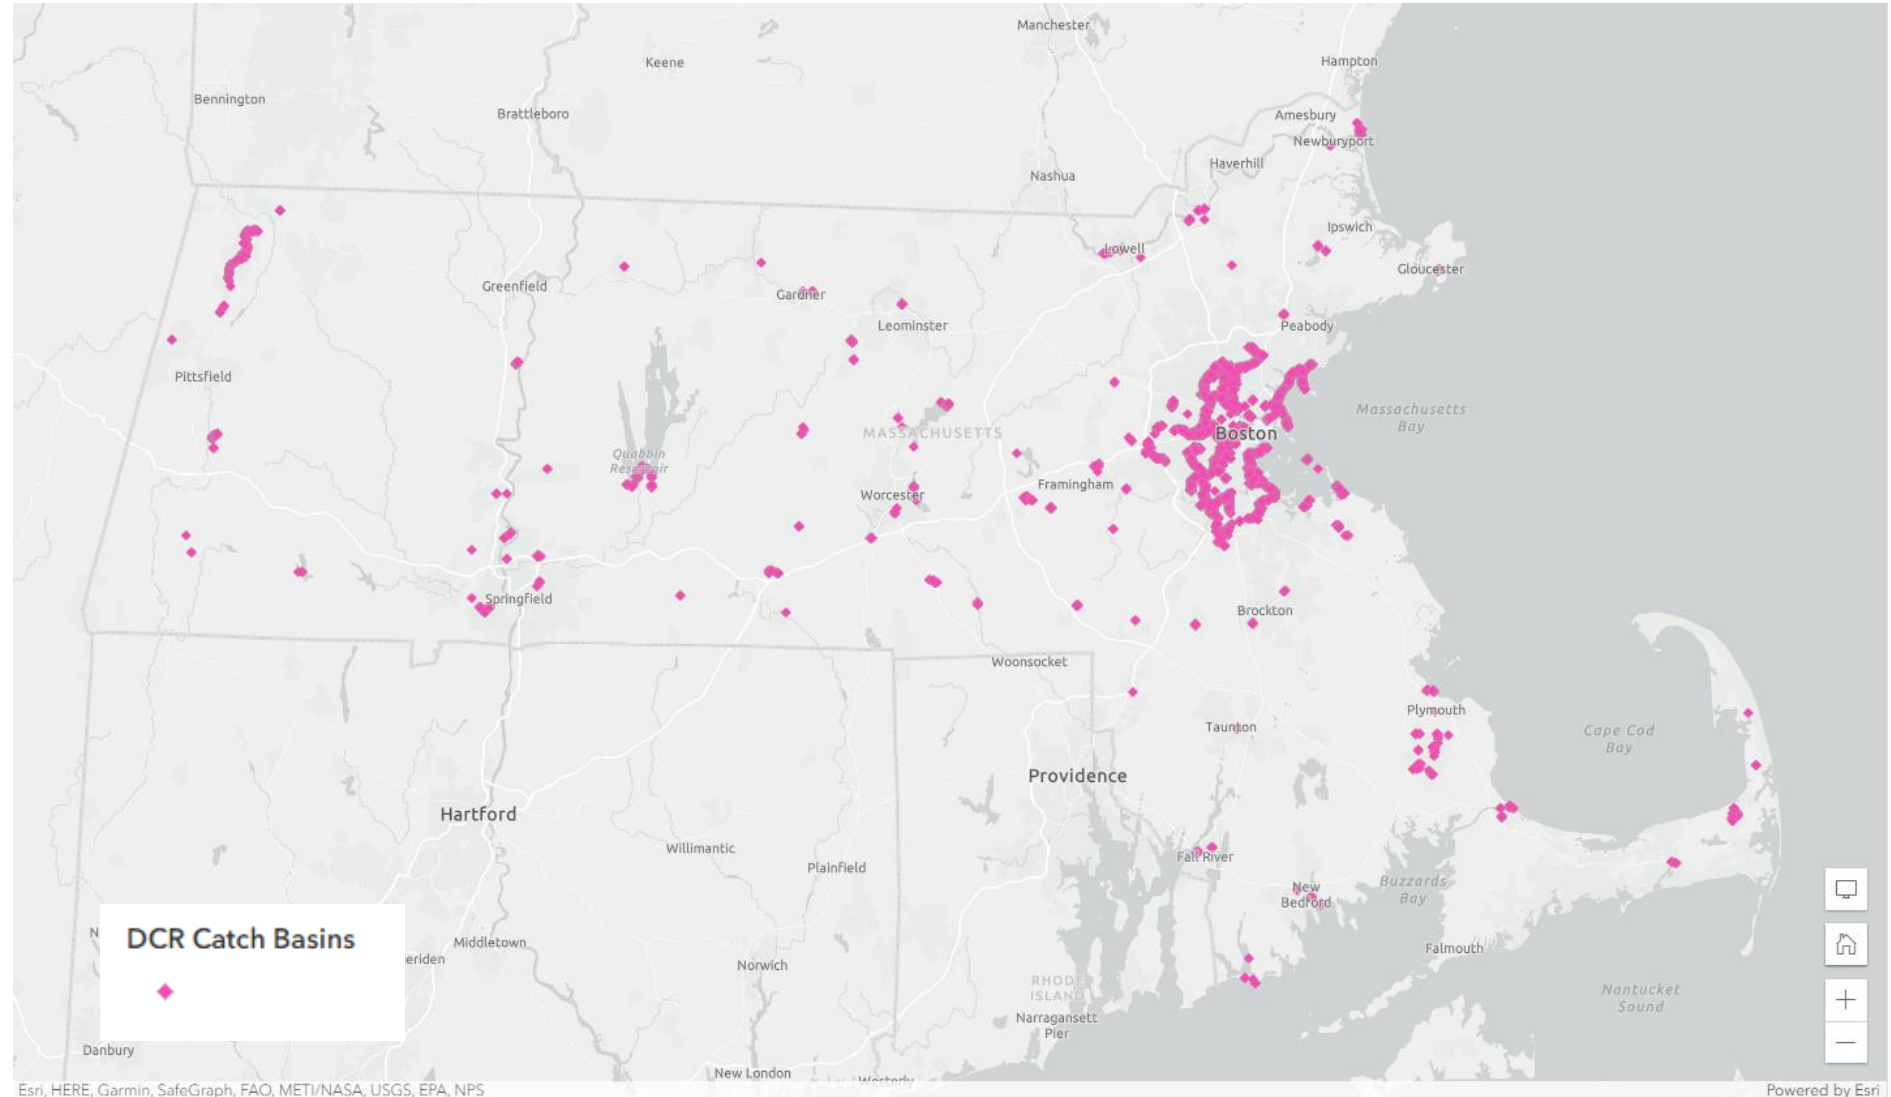

“optimization of catch basin cleaning”

Regular cleaning of catch basins to ensure their sumps are never >50% full

Existing Conditions

- 55,000+ Acres of regulated DCR property statewide
- 7500+ Catch Basins Statewide
- DCR regularly cleaned catch basins
 - Prioritized areas with **high sediment loading** and areas with a **history of flooding**

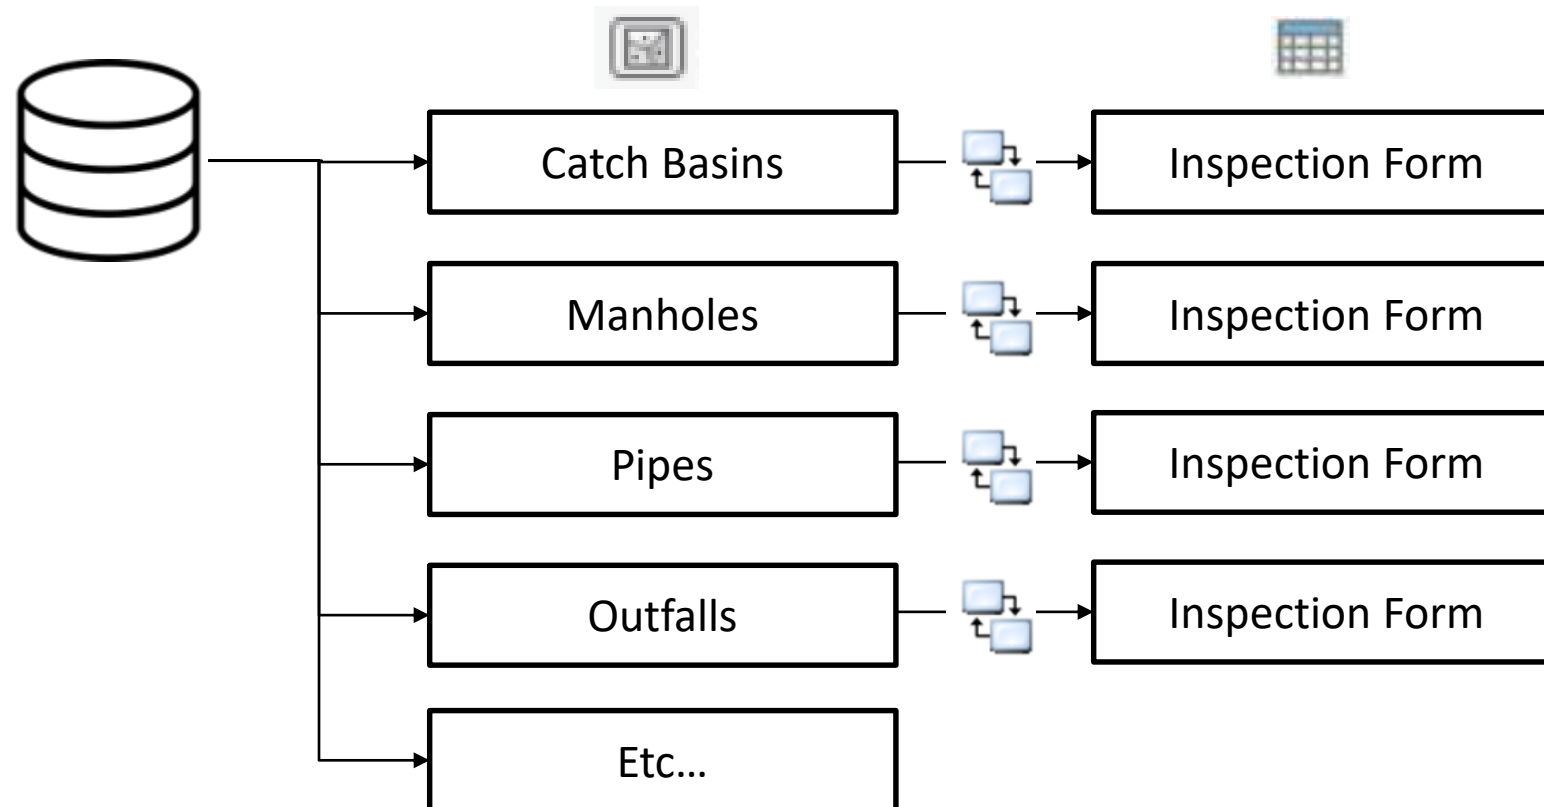

Catch Basin Cleaning Optimization Goals

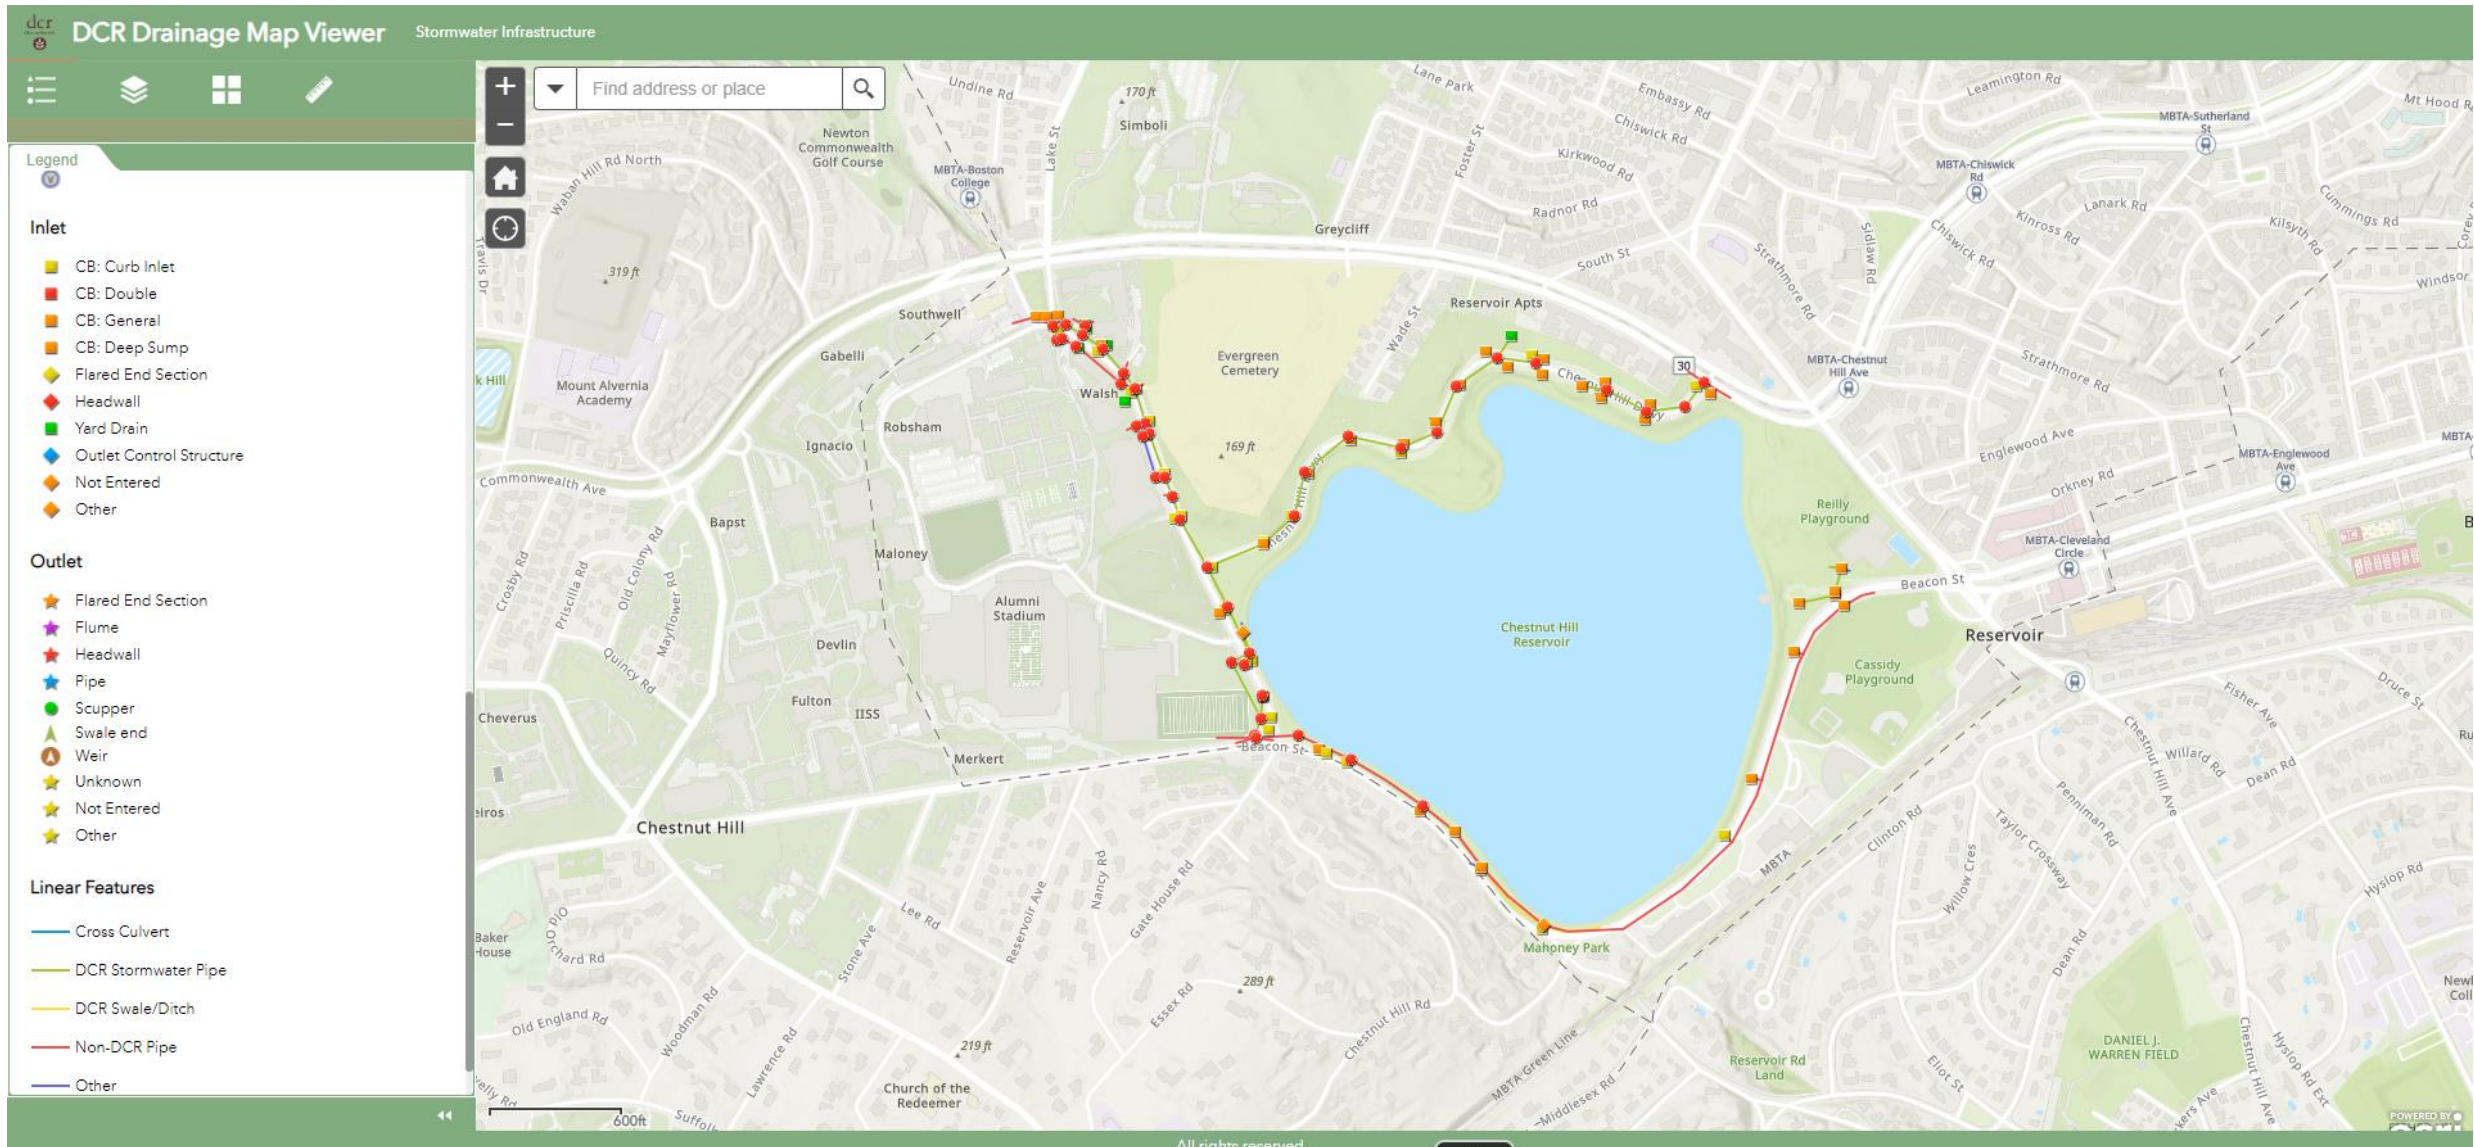

- Improve water quality by reducing sediment loading to receiving waterbodies
 - Regular cleaning of catch basins to ensure their sumps are never >50% full
- Maximize use of limited resources
 - Optimize efficiency by only visiting catch basins when needed
 - Leverage historic and real-time data
 - Create a user-friendly application for planning and tracking

DCR GIS Drainage Geodatabase

- Enterprise geodatabase hosted by VHB containing DCR Stormwater Assets and Inspection and Maintenance Data

- Data published to ArcGIS Server and used in online content for field data collection and analysis, and public use
 - Utilizes shared ArcGIS Online group where VHB, DCR Staff, and Subcontractors can access and update data

Catch Basin Prioritization System

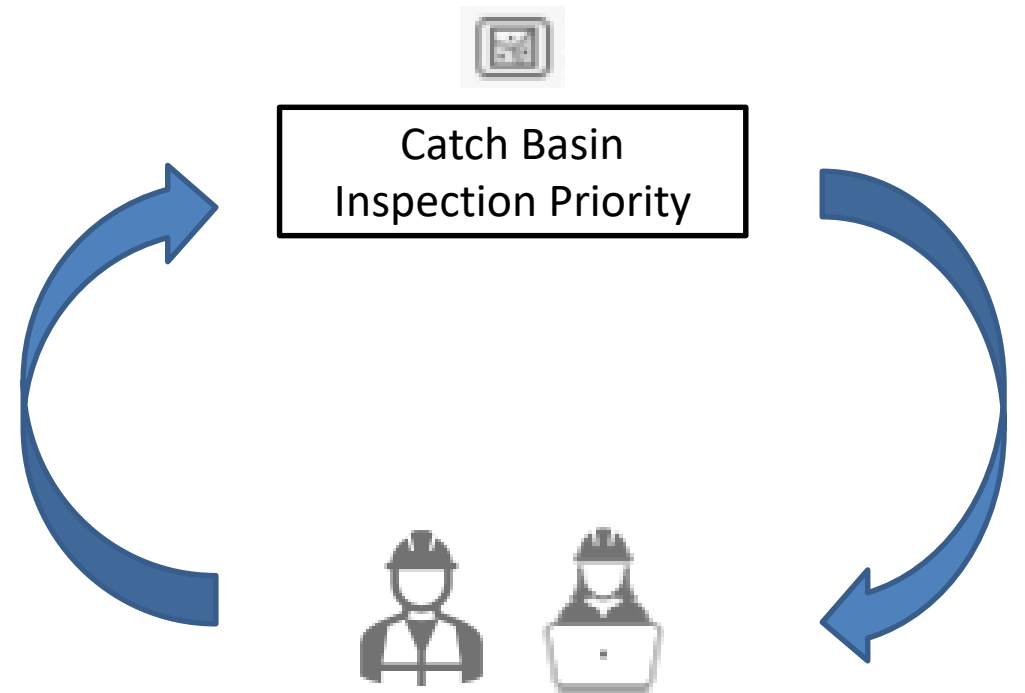

Goal: Prioritize catch basins in need of cleaning using historical inspections and on-going field data collection

- Use **last 5 year of inspection** data and **recorded sediment level** to assign catch basins a priority and associated inspection frequency
 - Priorities 1 & 2: Inspect Once Per Year
 - Catch Basins in **flood concern** areas
 - Catch Basins with **high sediment loading** based on inspection data
 - Catch Basins with **no inspection data**
 - Priorities 3: Inspect Once Every 2 Years
 - Catch Basins with **moderate sediment loading** based on inspection data
 - Priorities 4 & 5: Inspect Once Every 3 Years
 - Catch Basins with **low sediment loading** based on inspection data

Automated Prioritization Strategy

Goal: Update catch basin prioritization and inspection status in real-time

- Update prioritization when
 - New inspections are added
 - Catch basin data is updated
 - Ownership
 - Flood Concern
 - Inlet Type

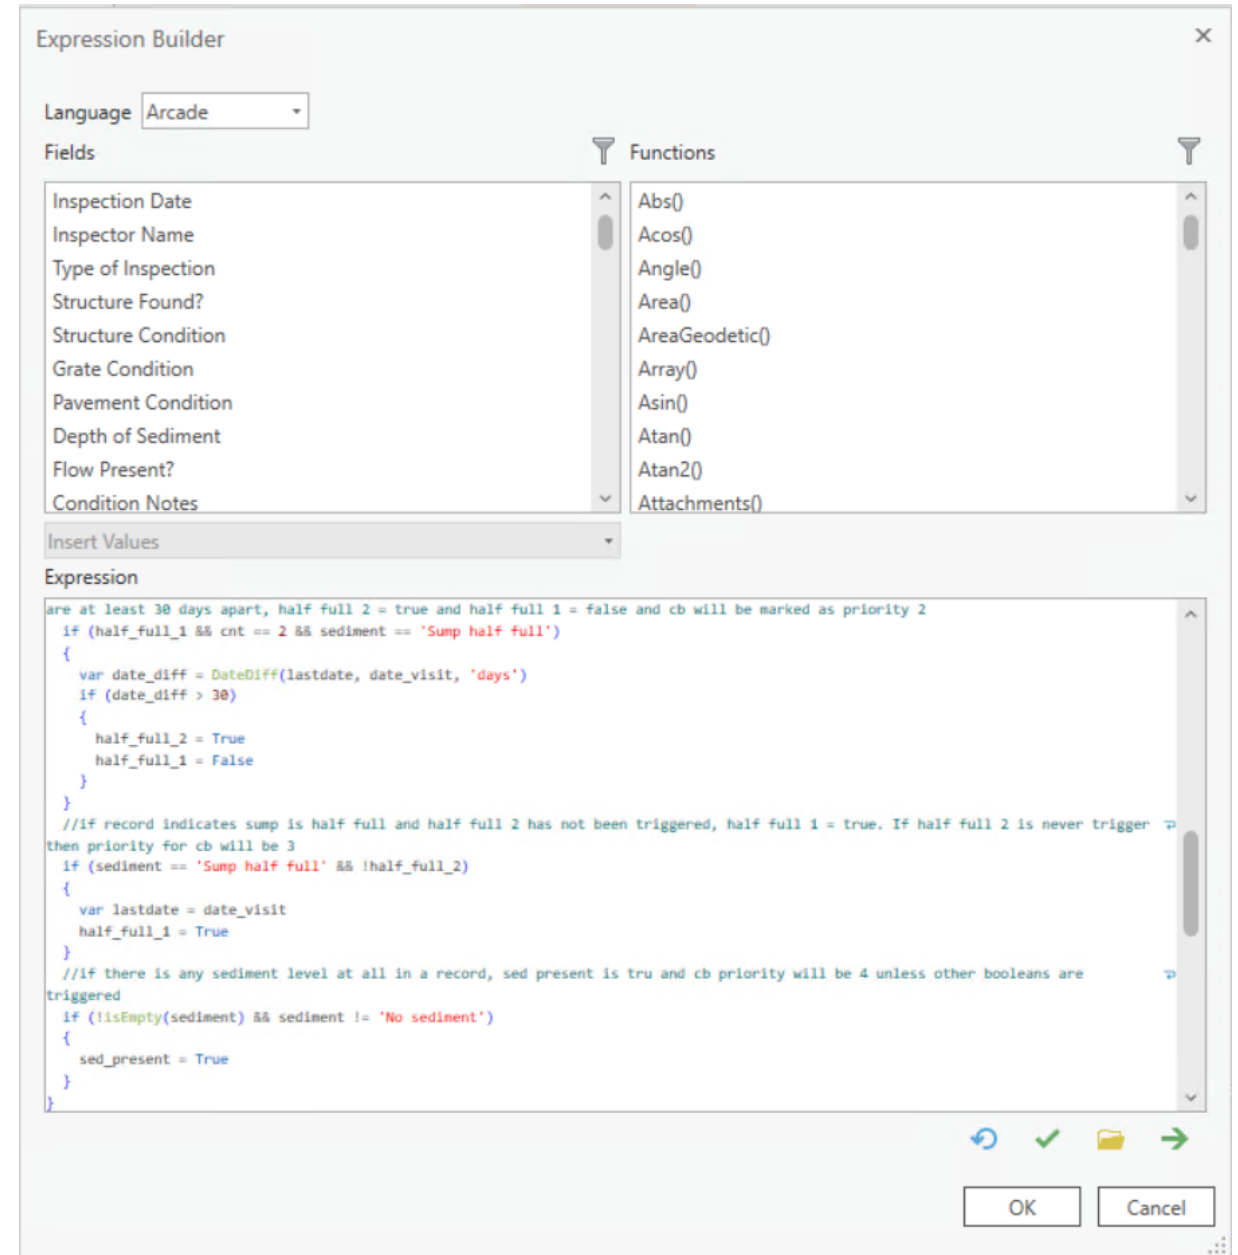

Automated Python Script

- Initially used python script tool that automatically ran every 30 minutes via Windows Task Scheduler
- Drawbacks:
 - Not “Real-Time”
 - Negatively Impacted database performance

Attribute Rules

- Transitioned to Calculation Attribute Rules
 - Arcade scripts that populate attribute values
 - Triggered automatically when features are inserted, updated, or deleted

Inspection Tracking Layer

Goal: Create spatial data layer that can summarize and track inspection status

- Need to join catch basin geometry with and inspection data
 - Needs to be live (i.e., continuously updated)
- Need to track whether most recent inspection satisfies the catch basin's inspection requirement

Solution: Created SQL view layer in enterprise geodatabase

SQL View Layer

- Created in SQL Server Management Studio (SSMS)
 - Joins Catch Basin with most recent inspection record
 - Includes fields from both catch basin layer and inspection table
 - Assigns inspection frequency based on inspection priority
 - Calculates if most recent inspection falls within frequency window
 - If True: *INSP_STATUS (Inspection Status)* = 1
 - If False: *INSP_STATUS (Inspection Status)* = 0

```
WITH insp AS (SELECT *, ROW_NUMBER() OVER (PARTITION BY ASSETGUID  
ORDER BY DATE_VISIT DESC) AS ASSETSORT  
FROM DCR_INLET_FORM_EVW  
WHERE (INSPECT_TYPE NOT IN ('IDDE Dry Weather', 'IDDE Wet Weather', 'IDDE Catchment Investigation') OR  
INSPECT_TYPE IS NULL) AND (DEPTH_OF_SEDIMENT <> 'Not observed' AND DEPTH_OF_SEDIMENT IS NOT NULL))
```

```
SELECT vw.*, DATEDIFF(month, vw.DATE_VISIT, DATEFROMPARTS(YEAR(GETDATE()), 12, 1)) AS DATE_DIFF,  
CAST(CASE WHEN INSPECTRANGE IS NULL THEN NULL WHEN DATEDIFF(month, vw.DATE_VISIT,  
DATEFROMPARTS(YEAR(GETDATE()), 12, 1)) <= vw.INSPECTRANGE THEN 1 ELSE 0 END AS INT) AS INSP_STATUS
```

```
FROM (SELECT inlet.SHAPE, inlet.OWNER, inlet.GDB_GEOMATTR_DATA, inlet.OBJECTID AS INLET_OBJECTID, inlet.INLET_TYPE, inlet.INSPECT_PRIORITY, inlet.FLOOD_PRIORITY, inlet.SEARCH_ID,  
inlet.STRUCTURE_ID AS STRUCTURE_ID_Inlet, inlet.Date_Added, insp.INSPECTOR, insp.INSPECT_TYPE, insp.STRUCTURE_FOUND, insp.ACCESSIBLE, insp.ACCESSNOTES,  
insp.STRUCTURE, insp.GRATE, insp.PAVEMENT, insp.DEPTH_OF_SEDIMENT, insp.DRY_WEATHER_FLOW, insp.CNOTES, insp.CLEANED, insp.FIXED, insp.NEEDS_SERVICE, insp.NEEDS_CLEANING,  
insp.BROKEN_PIPE, insp.FNOTES, insp.INSP_AFFILITATION AS INSP_AFFILIATION, insp.DATE_VISIT, inlet.INSPECT_COUNT, insp.GlobalID AS insp_GlobalID, insp.ASSETGUID, inlet.GlobalID AS Inlet_GlobalID,
```

```
CAST(CASE WHEN inlet.INSPECT_PRIORITY = '1' OR  
inlet.INSPECT_PRIORITY = '2' THEN 12 WHEN inlet.INSPECT_PRIORITY = '3' THEN 24 WHEN inlet.INSPECT_PRIORITY = '4' OR  
inlet.INSPECT_PRIORITY = '5' THEN 36 END AS INT) AS INSPECTRANGE
```

```
FROM DCR_INLET_EVW inlet LEFT JOIN  
insp ON inlet.GlobalID = insp.ASSETGUID AND ASSETSORT = 1) AS vw  
WHERE INLET_TYPE IN ('CB: Curb Inlet', 'CB: Deep Sump', 'CB: Double', 'CB: General') AND (OWNER IN ('DCR', 'Unknown') OR  
OWNER IS NULL)
```
