Charles River Watershed Association

Resilience, water and energy recovery concept, and modeling overview

BACKGROUND

Massachusetts Water Resources Authority Wastewater System

Image Source: AECOM

Sewer Extraction – Conceptual Sketch

Adapted from Barwon Water Sewer Mining Guidelines (2011)

Community Water and Energy Resource Center = CWERC

Integration into Institutional Building

URBAN SMART SEWERING MODEL SUBMODULES

Neighborhood # 2 CWERC – Example of Model Outputs

- WASTEWATER TREATMENT W/WATER REUSE
- THERMAL ENERGY
- ANAEROBIC DIGESTION W/ENERGY RECOVERY
- BIOSOLIDS PROCESSING W/COMPOSTING
- FOOD WASTE SOLIDS PROCESSING W/ NUTRIENT RECOVERY
- REC/RIN

Marrying potable, storm-, waste-, surface and groundwater management to restore the natural water cycle

INTEGRATING STORMWATER MANAGEMENT

Resource to Waste to Resource

Community Water and Energy Resource Centers (or CWERCs) maximize resource recovery

Urban Wetlands

Stormwater Wetland	Drainage Area(s) Treated	Design Storm*	Wetland Area (acres)
Goldsmith	Goldsmith Brook	10 inches (100 year +10%)	32
Bussey West	Bussey Brook	10 inches (100 year +10%)	51
Bussey East	Bussey Brook/Upper Stony	5.5 inches (10 year +10%)	22
Canterbury North	Canterbury Brook	>10 inches (100 year +10%)	49
Canterbury South	Canterbury Brook	10 inches (100 year +10%)	101
Upper Stony Large	Upper Stony	5.5 inches (10 year +10%)	34
Upper Stony Small	Upper Stony	5.5 inches (10 year +10%)	8

Replacing a centralized system with a distributed network of CWERCs
and extensive green infrastructure implementation

EXPANSION AND REPLICATION

Lessons from Nature:

Keep Water Local

- Offset the impacts of infiltration and inflow: about 40% of flow to Deer Island is relatively clean groundwater or rainwater
- Reduce potable water demand from Quabbin or local sources

Existing

Proposed

Lessons from Nature:

Flexible, Adaptable, Interconnected

- A decentralized or distributed network of CWERCs to serve our water and energy needs
 - Resilient and redundant
 - Equitable
 - Efficient
- Integrated stormwater management using green infrastructure, wetland restoration and stream daylighting

FIG. 1 – Centralized, Decentralized and Distributed Networks

CWERC Expansion Model

- Goal: Model replacing centralized system with CWERCs
- Methodology
 - Developed “unit multipliers” based on pilot scale plants (i.e. energy produced / gallon ww treated, etc.)
 - Modeling done on municipal scale
 - Developed multiple scenarios for varying conditions

CWERC Expansion Model

	Storage (% current daily flow)	Water Resale Value (% 2014 rates)	Wastewater Fee (% 2014 rates)
Scenario A: Max Storage	500%	57%	0%
Scenario B: Low Rates w/fees	300%	60%	37%
Scenario C: Thermal Credits in APS (Alternative Energy Credit Added for Thermal Energy)	300%	60%	37%

Modeling Results Summary

Scenario	A	B	C
Total capital cost	\$6,678,992,512 (~125-175 CWERCs)	\$6,061,272,512 (~125-175 CWERCs)	\$6,061,272,512 (~125-175 CWERCs)
Net annualized cost (5%)	\$(394,680,023)	\$(85,897,238)	\$(32,529,246)
Net annualized cost (4%)	\$(347,927,075)	\$(43,468,330)	\$9,899,662
Net annualized cost (3%)	\$(301,174,127)	\$(1,039,422)	\$52,328,570

Potential avoided costs for O&M and capital upgrades for centralized system:
\$118-200 million annually

1.8 billion lbs of CO₂ reduced annually

Thank you for your time!

This publication from water experts at the Charles River Watershed Association (CRWA) and a team of industry experts explores a new and unique approach to water and energy management where human water systems are engineered to mimic natural water systems. This innovative technique for water and energy management is a must-read for water utility managers across the country and the globe.
